

# 工作记录15之python字符串处理

2016-09-23 17:09:49

```
1.去掉字符串中的所有非数字字符（除了“.”） >>>val = ''.join([c for c in val if c in '1234567890.']) >>>import re >>>
non_decimal = re.compile(r'[^\d.]+') >>> non_decimal.sub('', '12.34fe4e')
>>>import string >>>filter( lambda x: x in '0123456789.', s )
>>>import re >>>re.sub("[^0-9^.]", "", data)
>>>chrs = ''.join(chr(i) for i in xrange(256)) >>>deletable = ''.join(ch for ch in chrs if ch not in '1234567890.') >>>a
='27893jksnf8u2qrtq2ntkjh8934yt8.298222rwagasjkijw' >>>for i in xrange(1000000): a.translate(chrs,
deletable) 详细参阅： http://stackoverflow.com/questions/947776/strip-all-non-numeric-characters-except-for-from-a-string-in-python
```
